An egg becomes a frog

In spring a female frog lays her eggs in a pond.

The eggs begin to grow with a cushion of jelly round them. This is known as frog spawn.

After two weeks a tadpole hatches out and grows gills like a fish.

An egg becomes a frog

After 6 weeks its back legs begin to grow and later its front legs.

Lungs grow inside its body and its tail shrinks.

It becomes a tiny frog that can live on land as well as in water.
